

**Aim:**

**Problem Description:**

Johny is a programming enthusiast who enjoys solving different coding challenges. One day, he decided to write a program to check for a "poor" triple of numbers.

A triple of numbers is considered "poor" when two of the numbers are equal, and the third number is different from the other two.

Your task is to help Johny determine whether a given set of three integers( $A, B, C$ ) forms a "poor" triple.

**Constraints:**

- $1 \leq A, B, C \leq 50$

**Input Format:**

- The input consists of a single line containing three integers  $A, B$ , and  $C$ , separated by spaces.

**Output Format:**

- Print "Yes" if the given triple is "poor," and "No" otherwise.

**Source Code:**

`triple.c`

```
#include<stdio.h>
int main(){
    int A,B,C;
    scanf("%d %d %d" , &A, &B, &C);
    if((A == B && B!= C) || (A == C && A!= B) || (B == C && B!=A))
    {
        printf("Yes\n");
    }
    else
    {
        printf("No\n");
    }
    return 0;
}
```

**Execution Results** - All test cases have succeeded!

Test Case - 1
User Output
23 18 34
No

  

Test Case - 2
User Output
18 10 45

No
----

Test Case - 3
User Output
39 28 39
Yes

Test Case - 4
User Output
12 8 8
Yes

Test Case - 5
User Output
15 15 15
No

Test Case - 6
User Output
10 10 15
Yes

Test Case - 7
User Output
7 7 5
Yes
